EDUCATION

University at Buffalo

Buffalo, NY

Bachelor of Science in Computer Science, GPA: 3.4 / 4.0

May 2025

Relevant Coursework: Data Structures, Systems Programming, Web Applications, Algorithm and Complexity, Object-oriented Programming, Artificial Intelligence / Machine Learning, Systems Administration, Algorithm for Modern Compute System

TECHNICAL SKILLS

Programming Languages: Python, Java, JavaScript, PHP, HTML, CSS, C++, C, Arm Assembly.

Frameworks & Tools: Agile method, Kanban, Visual Studio Code, IntelliJ Idea, Android Studio, React, Flask, MySQL, Docker, Git, GitHub, Linux, Figma, Auth0, GoDaddy Registry, Comet, MongoDB, RESTful APIs, Hugging Face AI, Quartus, PuTTY, MQTT, MinIO, Emacs.

EXPERIENCES/AWARDS

University at Buffalo

Buffalo, NY

UB AI Hacking Participant | JavaScript, HTML, Hugging Face AI, Google Chrome

Feb 2025

- 1st place out of 53 teams in the "Best AI for Good" competition by developing [WebAble](#), an AI powered web accessibility toolkit.
- Enhanced user inclusivity by 60%+ (based on accessibility testing benchmarks) through features like voice navigation, auto alt text generation, dyslexia friendly formatting, and real time text simplification.
- Engineered a Chrome extension powered by Hugging Face NLP models (transformers) for accessibility tasks, including prompt based text simplification and AI driven content labeling. Tuned generative model responses for real time web adaptation.
- Coordinated code reviews and collaborated with a 4 person interdisciplinary team, contributing to a 25% improvement in code quality through performance testing while mentoring peers in AI integration for a scalable deployment.

University at Buffalo

Buffalo, NY

UB Hacking Participant | JavaScript, HTML/CSS, Flask, Auth0, GoDaddy Registry

Nov 2024

- Awarded for Best use of Auth0 in competition with 88 other groups participating.
- Collaborated with a team to create a study website aiming towards students to better improve study habits and their efficiency within a 24 hour limit.
- Assisted in refining the website security to enhance features availability to those who are in use of the feature.
- <https://devpost.com/software/mindbox-study>

PROJECTS

Full Stack Web Chat Application | Python, JavaScript, HTML/CSS, MongoDB, RESTful APIs, Flask, Docker

Spring 2024

- Built a secure chat platform with file upload preview logic and real time messaging; implemented user authentication, RBAC, and REST API endpoints using Flask and MongoDB; deployed to Docker for containerized testing.
- Implemented user authentication, data encryption, and WebSocket protocols for instant messaging.
- Architected backend services to handle concurrent client connections over TCP sockets, ensuring message reliability and delivery consistency.
- Enabled file transfer functionality with message status indicators, leveraging Flask and Docker for scalable local deployment.

Full Stack Recipe Web Application | Agile, React, Node.js, JavaScript, PHP, MySQL, Figma, Github, Kanban board

Spring 2025

- Designed and developed a full stack recipe web application with a rich feature set using React, Node.js, HTML, CSS, JavaScript, and PHP for backend services with a MySQL database.
- User account authentication was strictly and securely put in place giving users the ability to view trending content, save, edit, filter recipes provided on the web app.
- Improved the user experience for bigger datasets with better searching and filtering functionality.
- Worked iteratively, made small changes over the sprint cycles, and exercised Agile development and task management with Kanban board.

Wireless Localization | Undergraduate Research Assistant | MQTT, Android Studio, Python, Comet, Github, Linux Env

Spring 2025

- Simulated a real world software engineering work environment and work processes using Kanban board and practiced Agile project management, and ML python libraries with neural networks.
- Assisted the team in developing and optimizing the ML model to improve the accuracy of the predicted location data
- Trained and deployed the ML model with 1,000s of collected CSI data to assist in predicting indoor location.
- Cleaned and preprocessed large sets of Channel State Information (CSI) data to train ML models; worked with time series signals and deployed models in simulation environments for testing predictive accuracy.
- Executed core software programs in a Raspberry Pi Linux environment, allowing real time efficient data collection and transfers.
